

**Amendments to the Claims:**

Please replace all prior versions, and listings of claims in the application with the following listing of claims.

**Listing of claims**

Claim 1 (currently amended): A look up engine comprising a storage means for storing a look up table, said look up table comprising a plurality of entries, each entry comprising a value and an associated key value, such that, in operation, a look up is carried out by outputting a value which is associated with the stored key value which matches an input key value, the look up engine comprising a plurality of look up state machines connected in parallel to enable multiple look ups of different search requests to be carried out in the same look up table ~~to be carried out~~ concurrently, the state machines all having concurrent access to all the entries in the ~~whole of the~~ look up table ~~whenever~~ when they perform a look up.

Claim 2 (original): A look up engine according to claim 1, wherein the entries are stored in a trie structure.

Claim 3 (original): A look up engine according to claim 2, wherein the trie structure is a PATRICIA trie structure.

Claim 4 (original): A look up engine according to claim 1 further comprising an input buffer and an output buffer.

Claim 5 (original): A look up engine according to claim 4, wherein the look up engine further comprises a distributor for distributing the input key values between the plurality of look up state machines.

Claim 6 (original): A look up engine according to claim 5, wherein the look up engine further comprises a collector for collecting the outputs from the plurality of look up state machines for outputting the lookup value.

Claim 7 (original): A look up engine according to claim 1, wherein the length of the key values and the values is fixed.

Claim 8 (previously presented): A look up engine according to claim 1, wherein the length of the key value and the values is variable.

Claim 9 (original): A look up engine according to claim 1, wherein the look up engine further comprises a tagging mechanism in which each key value has a tag associated therewith such that the output values can be ordered in accordance with the order of receipt of the input key value.

Claim 10 (original): A look up engine according to claim 1, wherein the look up engine comprises means for storing the identity of a requestor requesting look up for each look up request such that the output value is sent to the correct location.

Claim 11 (previously presented): A look up engine according to claim 1, wherein at least one of the output values comprises an error message which is output to indicate a look up failure.

Claim 12 (previously presented): A look up engine according to claim 11, wherein the error message further comprises additional data including indication of the type of error.

Claim 13 (original): A look up engine according to claim 12, wherein the additional data includes indication of the number of bits of the input key value which matched.

Claim 14 (canceled)

Claim 15 (original): A look up engine according to claim 1, wherein the storage means comprises internal and/or external memory.

Claim 16 (original): A look up engine according to claim 15, wherein the storage means comprises a plurality of independent, parallel memory banks, each memory bank containing at least one table of the plurality of entries.

Claim 17 (original): A look up engine according to claim 16, wherein the tables are mutually exclusive.

Claim 18 (original): A look up engine according to claim 17, wherein the input key value comprises a table identifier for identifying which of the tables is required.

Claim 19 (previously presented): A look up engine according to claim 15, wherein the look up state machines can be bypassed in operation such that the storage means is utilized as memory for a processing means.

Claim 20 (original): A look up engine according to claim 19, wherein the storage means is dynamically partitioned for use as memory by the processing means and for storing the plurality of entries.

Claim 21 (currently amended): A method for looking up a value, the method comprising the steps of:

- (a) receiving an input key value;
- (b) comparing the input key value with a plurality of stored key values;
- (c) outputting the value associated with the stored key value that matches the input key value, wherein steps (a), (b) and (c) are carried out concurrently by means of a plurality of look up state machines connected in parallel whereby to enable multiple look ups of different search requests relating to a plurality of values and associated key values corresponding to a plurality of input key values to be carried out on a same look up table concurrently, the state machines all having concurrent access to all the entries in the ~~whole of~~ the look up table ~~whenever~~ when they perform a look up.

Claim 22 (currently amended): A method for looking up a value, the method comprising the steps of:

- (a) receiving an input key value;
- (b) dividing the input key value into a plurality of predetermined portions;
- (c) comparing each predetermined portion of the input key value with a plurality of stored key values;

(d) outputting the value associated with the stored key value that matches the predetermined portion of the input key value;

(e) producing a final key value from the look-up values;

(f) comparing the final key value with a plurality of stored key values; and

(g) outputting the value associated with the stored key value that matches the final key value, wherein steps (c) to (e) are carried out concurrently by means of a plurality of look up state machines connected in parallel whereby to enable multiple look ups of different search requests relating to a plurality of values and associated key values corresponding to a plurality of input key values to be carried out on a same look up table concurrently, the state machines all having concurrent access to all the entries in the ~~whole of the~~ look up table ~~whenever~~ when they perform a look up.

Claim 23 (currently amended): A computer system comprising a plurality of processing means interconnected via a bus system, the computer system further comprising a look up engine, the look up engine comprising a storage means for storing a look up table, said look up table comprising a plurality of entries, each entry comprising a value and an associated key value, such that, in operation, a look up is carried out by outputting a value which is associated with the stored key value which matches an input key value, the look up engine comprising a plurality of look up state machines connected in parallel to enable multiple look ups of different search requests to be carried out in the same look up table ~~to be carried out~~ concurrently, the state machines all having concurrent access to all the entries in the ~~whole of the~~ look up table ~~whenever~~ when they perform a look up.

Claim 24 (original): A computer system according to claim 23, wherein the look up engine is connected to the bus system via a plurality of parallel interface units, the interface units allowing concurrent update of the entries and look up.

Claim 25 (original): A computer system according to claim 23, wherein multiple keys are submitted for look up in a single bus transaction.

Claims 26-36 (canceled)

Claim 37 (previously presented): A look up engine according to claim 11, wherein each entry further comprises a skip value and each key value comprises a plurality of bits, and wherein the error message is sent if the skip value mismatches skipped bits of the input key value.
